

Hitching up your 5th wheel just got a whole lot easier ...

With the ZAXIS Landing Gear Remote Control, you can raise or lower your 5th wheel trailer's landing gear to the perfect height for hitching up without ever leaving your tow vehicle. No more getting in and out of your tow vehicle to "eyeball" the kingpin and receiver alignment. Imagine being able to adjust your trailer's kingpin height as you back your tow vehicle towards the trailer. Just use the ZAXIS key chain transmitter to control your 5th wheel trailer's landing gear for a quick, easy, no guesswork hitch-up.

You can even use the ZAXIS Landing Gear Remote Control to raise or lower the landing gear from inside your 5th wheel making fore/aft leveling of your RV easy.

The ZAXIS Landing Gear Remote Control consists of one receiver unit and one keychain transmitter. Additional keychain transmitters can be purchased separately.

**ZAXIS Keychain Transmitter**

**ZAXIS Receiver**

(Shown mounted in a 5th wheel basement.)

ZAXIS employs a sophisticated "Rolling Code" security system to insure that only your keychain transmitter(s) can operate your ZAXIS receiver. ZAXIS will operate only when it receives commands from a keychain transmitter it has "learned." This prevents anyone else from operating your landing gear even in a crowded RV park with other ZAXIS owners nearby.

**Get your ZAXIS Landing Gear Remote Control today for \$149.95**
